Abdellatif Mamoun 🙋

Cloud & DevOps Engineer

📍 Antibes, France

I am a Cloud & DevOps Engineer focused on building scalable, automated and resilient systems. I help engineering teams deploy and operate applications reliably through Cloud platforms (**Kubernetes**, **Cloud Foundry**), **CI/CD** automation, Infrastructure as Code and production observability.

I enjoy transforming repetitive operational tasks into dependable tools and workflows that help teams deliver faster, reduce risk and operate their services with confidence.

I currently work at [Davidson](#), supporting [Orange](#) as a consultant in Sophia Antipolis.

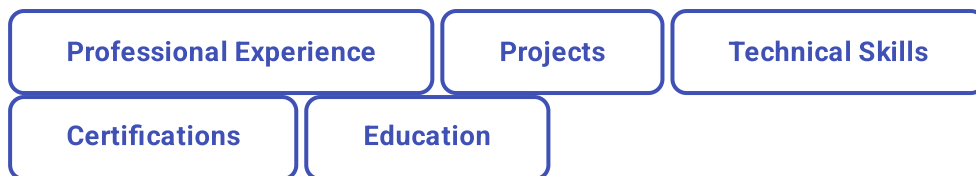

Let's connect

Feel free to reach out by email or connect with me on LinkedIn and GitHub.

Learn more about my technical background, professional experience, education and certifications.

Areas of Focus

Cloud & Container Platforms

Building and operating containerised platforms across **Kubernetes**, **Cloud Foundry** and **AWS**.

CI/CD & Automation

Designing secure pipelines and repeatable workflows for reliable application and infrastructure delivery.

Reliability & Observability

Improving production reliability through monitoring, centralised logging, secrets management and recovery practices.

Professional Experience

Cloud & DevOps Engineer — Contractor

Orange — Davidson R&D

 May 2022 – Present

 Sophia Antipolis, France

Cloud & DevOps Engineer, working as a Contractor for **Orange** within the **AAC (Architecture et Accompagnement Cloud)** team. Contributing to the automation, integration, modernization, and operation of applications and services across private-cloud environments, with a strong focus on reliability, security, maintainability, and DevOps best practices.

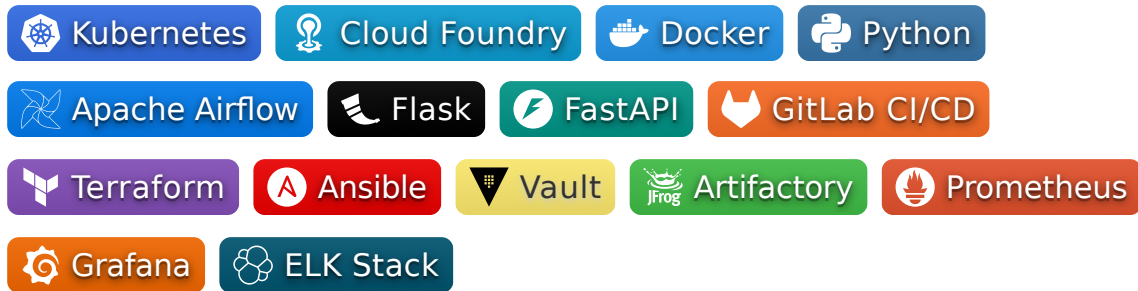

Key Responsibilities

- **Deployment, operation, and maintenance** of cloud-native applications on **Kubernetes** and **Cloud Foundry**.
- **Migration of tools and applications** to standardized and sustainable on-premises cloud platforms, improving maintainability and long-term support.
- **Design and implementation** of application integration and automation workflows using **Apache Airflow**.
- **Setup and improvement** of **GitLab CI/CD pipelines** for automated testing, packaging, and application deployment.
- **Securing and management** of application secrets and sensitive configurations using **HashiCorp Vault** and encryption mechanisms.
- **Automation of resource provisioning and configuration**, including *DNS records, certificates, load-balancing services, and reverse proxies*.
- **Centralization of application and infrastructure logs** using the **ELK Stack**.
- **Implementation of monitoring, alerting, and observability solutions** with **Prometheus, Grafana, and Xymon**.
- **Definition and implementation of backup and disaster-recovery procedures** using **S3-compatible storage**.
- **Packaging, versioning, and publication** of internal libraries and application artifacts through **JFrog Artifactory**.
- **Development of internal APIs and web interfaces** using **Flask** and **FastAPI**.
- **Production incident investigation and root-cause analysis**, including corrective and preventive actions.
- **Production of technical documentation and operational procedures** to improve maintainability and knowledge sharing.

Key Contributions

- **Automation of recurring infrastructure and application-management tasks**, reducing manual operations.
- **Standardization of reusable CI/CD pipelines**, improving deployment reliability and consistency.

- **Centralization of secrets and configuration management**, strengthening platform security.
- **Modernization and migration of workloads** toward maintained and sustainable private-cloud platforms.

DataOps Engineer – Internship

Strateg.In

📅 Aug 2021 – Feb 2022

📍 Toulouse, France

Master's Final-Year Project (Projet de Fin d'Études – M2) focused on designing and industrializing DataOps pipelines, from data preparation and machine-learning workflows to API integration and deployment on cloud-native infrastructure.

Key Responsibilities

- **Design and implementation of customer data-processing workflows**, including extraction, cleaning, analysis, and machine-learning models such as *Random Forest*, *SVM*, and *XGBoost*.
- **Automation of DataOps workflows** using **Argo Workflows**, containerized with **Docker** and deployed on **Azure Kubernetes Service (AKS)**.
- **Development of APIs** for integration and production deployment of data-processing results.
- **Monitoring and visualization of pipeline performance** to improve processing reliability and operational visibility.
- **Integration of data-processing components** with storage, search, and application services.

Software Development Engineer — Internship

INP-ENSEEIH

📅 Jun 2020 – Aug 2020

📍 Toulouse, France

Software development internship focused on the creation of educational tools for automated and interactive source-code evaluation at **INP-ENSEEIH**.

Key Responsibilities

- **Development of code-processing modules** for automated and interactive evaluation of programming exercises.
- **Implementation of source-code analysis mechanisms** based on *Abstract Syntax Trees (AST)*.
- **Development and integration** of educational tooling using *Python* and *Java*.
- **Version control and collaborative development** using *GitLab*.

Data Management System Developer — Internship

Marsa Maroc

📅 Jul 2019 – Aug 2019

📍 Casablanca, Morocco

Software development internship focused on the implementation of an internal UI for managing training-room reservations.

Key Responsibilities

- **Design and development of a desktop application** for training-room reservation management.
- **Implementation of data-management functionalities** using *MySQL*.
- **Development of the application logic and graphical interface** using *Java*.
- **Source-code versioning and project management** using *GitLab*.

Projects & Engineering Highlights

This selection combines public open-source projects with professional platform-engineering work. Public repositories demonstrate how I approach architecture, automation, security and operational quality; client work is intentionally presented at a confidentiality-safe level.

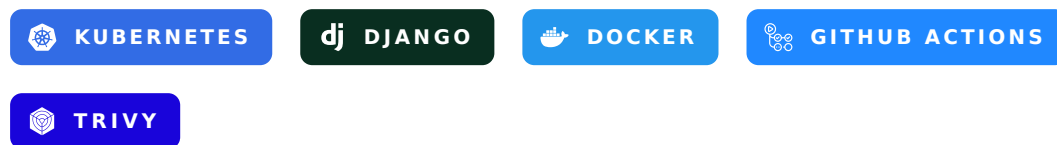

Open-Source Projects

KubeLens

A lightweight Kubernetes topology dashboard and internal developer platform that helps teams understand workloads, services and networking relationships directly from the cluster control plane.

Technical highlights

- Automatic local and in-cluster Kubernetes context discovery.
- Least-privilege access through dedicated ServiceAccounts and RBAC.
- DevSecOps quality gates covering linting, static analysis, IaC checks and container-image scanning.

Multi-Tenant Airflow

An automated platform for provisioning multiple isolated Apache Airflow environments while sharing core PostgreSQL, Redis and routing infrastructure.

Technical highlights

- Declarative tenant provisioning from YAML configuration.
- Tenant isolation across databases, Celery channels and HTTP routes.
- Automated validation of source code, configuration and generated Docker Compose infrastructure.

[Explore Multi-Tenant Airflow on GitHub](#)

Opsie

A cloud-native ChatOps engine that receives operational requests from Discord and processes them through an asynchronous FastAPI service with multi-model LLM routing.

Technical highlights

- Decoupled, containerised Discord bot and backend API services.
- Dynamic model-provider routing through LiteLLM.
- Structured telemetry and automated CI quality and security checks.

[Explore Opsie on GitHub](#)

Anatomopathology & Cancer Diagnostics

A Deep Learning project developed in collaboration with the [University Cancer Institute of Toulouse \(IUCT-Oncopole\)](#), focused on **unsupervised analysis of microscopy images for cancer diagnosis**.

Technical highlights

- Designed feature-transfer and domain-adaptation approaches for microscopy image analysis.
- Built unsupervised Deep Learning workflows for clustering and classification of medical images.
- Developed reproducible Machine Learning pipelines with Python, TensorFlow, Keras, and Scikit-learn.
- Containerised the development environment with Docker for consistent and portable experimentation.

Engineering Degree in Computer Science

INP-ENSEEIH

 Sep 2018 – Mar 2022 |  Toulouse, France

- **Specialization:** High Performance Computing & Big Data.
- Comprehensive training in Computer Science, combining Cloud Computing, Distributed Programming, HPC, and Data Science.

Preparatory Classes for Engineering Schools (CPGE)

CPGE Mohamed V

 Sep 2016 – Jul 2018 |  Beni Mellal, Morocco

- **Specialization:** MP (Mathematics & Physics).
- Intensive preparation for competitive entrance exams to top engineering schools.

Certifications & Continuous Learning

Continuous learning is part of my engineering practice. This page is ready to host verified certifications, technical training and public badges.

Moocs and Certifications

- **Cambridge English - Linguaskill Business**  *Issued:* January 2021
 *Expired:* January 2023
 *Credential ID:* FR014_RPIN7INP100
